Monitoring and observation of (global) biodiversity change

Dr. Cornelia Krug

Science Liaison Officer URPP GBC
Department of Geography, University of Zurich

Observation of biodiversity at different scales is the basis for understanding the response of the various facets of biodiversity to environmental change. It also allows to investigate feedbacks with drivers of change, and the potential impacts on human well-being. The talk will introduce efforts to advance the science of biodiversity observation, initiatives for global monitoring of biodiversity, and the role monitoring and observation of biodiversity change play for decision-making.
