

Report about visit to Montpellier

“Besprechungen, Geländearbeit (sammeln von Pflanzenproben für phylogenetische Analysen)”

Cooperation partner: Dr. Andrea Sanchez Meseguer, CBGP – INRA

During the visit to Montpellier several samples of plant species *Euphorbia cyparissias*, *E. duvalii*, *E. exigua*, *E. paralias*, *E. pinea* and *E. seguariana* were collected. The collecting trips were in the areas north (Plateau of Larzac) and south (Le Grande Motte) of Montpellier. The samples will be used for DNA extraction and sequencing in the future. Sequences will be phylogenetically analysed, including the samples from other region. Possible further cooperation with Dr. Andrea Sanchez Meseguer was also discussed.

Euphorbia paralias is a typical species of sand dunes and can be found also south of Montpellier.
