1	Constitutive Models in Finite Element Codes	1
	W. Fellin and A. Ostermann	
1.1	Introduction	1
1.2	The merits and pitfalls of one-dimensional considerations	3
1.3	Time integration of pure rate equations	5
1.3.1	Pure rate equation	5
1.3.2	Explicit integration	7
1.3.3	Adaptivity and error control	10
1.3.4	Implicit integration	12
1.3.5	Semi-implicit integration	13
1.3.6	Examples	14
1.4	Extensions to elasto-plastic models	16
1.4.1	Nonlinear elasticity, nonlinear isotropic hardening	16
1.4.2	Event location	18
1.4.3	Time integration of index 2 problems	19
1.4.4	Example	21
1.5	Consistent tangent operator	21
1.5.1	Incremental loading	21
1.5.2	The equilibrium iteration	23
1.5.3	Newton's method	23
1.5.4	Consistent tangent	24
1.5.5	The Jacobian	25
1.5.6	Analytical solution	25
1.5.7	Numerical time integration	25
1.5.8	Variational equation	26
1.5.9	Analytic solution of stress update and Jacobian	27
1.5.10	Numerical approximation of the Jacobian	27
1.5.11	Example	28
1.6	Fully three-dimensional formulation	31
1.6.1	Consistent tangent operator, Jacobian	31
1.6.2	Adaptive time integration	33

1.6.3	Application to hypoplasticity	33
1.6.4	Application to elasto-plasticity	34
1.7	Conclusion	36
A	Appendix – Hypoplastic model	37
A.1	Basic model	37
A.2	Extended hypoplastic model	38
A.3	Material parameters	39
	References	40
2	Barodesy: The Next Generation of Hypoplastic Constitutive Models for Soils	43
	D. Kolymbas	
2.1	Introduction	43
2.2	Empirical basis of barodesy	43
2.3	Early quests for alternatives to plasticity theory	44
2.4	Barodesy and hypoplasticity	45
2.4.1	About the name 'Barodesy'	45
2.5	Symbols and notation	46
2.6	Proportional paths A	47
2.7	Proportional paths B	49
2.8	Limit states	49
2.9	Incremental non-linearity	50
2.10	Consolidations and critical states	50
2.11	Cyclic loading, limit cycles and shake-down	52
2.12	Significance of barodesy	53
2.13	Open questions	54
	References	54
3	Seismic Performance of Tuned Mass Dampers with Uncertain Parameters	57
	C. Adam, M. Oberguggenberger and B. Schmelzer	
3.1	Introduction	57
3.2	Mechanical model	58
3.3	Modeling of the earthquake excitation	60
3.4	Modeling of the parameter uncertainty	63
3.4.1	Two examples of random sets for uncertainty modeling ..	64
3.5	Combination of stochastic excitation and parameter uncertainty ..	65
3.6	Numerical simulation and results	67
3.6.1	Parametric studies	67
3.6.2	Set-valued TMD parameters	72
3.6.3	Set-valued soil parameters	78
3.7	Conclusion	79
	References	81

4	Sensitivity and Reliability Analysis of Engineering Structures: Sampling Based Methods	85
	M. Oberguggenberger	
4.1	Introduction	85
4.2	Design of experiment	86
4.3	Random fields	91
4.4	Sensitivity analysis	93
4.5	Reliability analysis	96
4.6	Application	102
4.7	Conclusion	109
	References	109
5	Multi-Phase Models in Civil Engineering	113
	P. Gammitzer, M. Aschaber and G. Hofstetter	
5.1	Introduction	113
5.2	Primary Unknowns and Thermodynamic State Variables	114
5.3	Governing Equations	116
5.3.1	Balance Laws	116
5.3.2	Flux Approximations and Stress State Variables	118
5.4	Application to Geotechnical Engineering	121
5.4.1	A Modified Cap Model for Unsaturated and Saturated Soil	122
5.4.2	A Model Problem for Ground Settlements	128
5.4.3	Shear Failure of an Embankment Dam	135
5.5	Multi-Phase Model for Concrete	138
5.5.1	Constitutive Law for Concrete	141
5.5.2	Numerical Simulation of the Behavior of Concrete Overlays	143
5.6	Summary and Conclusions	147
	References	147
6	Concrete structures subjected to fire loading: From thermo- mechanical modeling of strain behavior of concrete towards structural safety assessment	149
	T. Ring, M. Zeiml and R. Lackner	
6.1	Introduction	150
6.2	Experimental observation	151
6.2.1	Deformation under thermo-mechanical loading	152
6.2.2	Behavior of siliceous material	153
6.3	Micromechanical model	154
6.3.1	Effective elastic properties	154
6.3.2	Effective (free) thermal strain	156
6.4	Implementation	157
6.5	Finite-element implementation and numerical results	163
6.6	Concluding remarks	165
	Appendix A	167

7 Scientific Computing in Urban Water Management	171
R. Sitzenfrei, M. Kleidorfer, M. Meister, G. Burger, C. Urich, M. Mair and W. Rauch	
7.1 Introduction	171
7.2 From water networks to an integrated assessment of urban water systems	173
7.2.1 State-of-the-art modelling approaches	174
7.2.2 Raster-based and node-based models	175
7.2.3 Definition of a framework for modelling approaches	176
7.2.4 Assessment tools and applications	178
7.3 Utilization of multicore facilities in software for simulating complexity and dynamics in urban water management	179
7.3.1 Requirements for simulations in urban water management	180
7.3.2 Model level parallelization	180
7.3.3 Performance improvement by batch-level parallelism ...	183
7.4 Smoothed particle hydrodynamics: an alternative numerical method to explore fluid phenomena	184
7.4.1 Motivation and aim	184
7.4.2 SPH for sewer modelling	186
7.4.3 SPH for wastewater treatment simulations	186
7.5 Conclusions and Outlook	187
References	188
8 Numerical Simulations in Hydraulic Engineering	193
R. Gabl, B. Gems, M. Plörer, R. Klar, T. Gschnitzer, S. Achleitner and M. Aufleger	
8.1 Introduction	193
8.2 Asymmetric Orifice	195
8.2.1 Investigation area	196
8.2.2 Basic equations	196
8.2.3 Modelling concept	199
8.2.4 Conclusion and further research	201
8.3 Spillway	202
8.3.1 Investigation area	202
8.3.2 Modelling concept	203
8.3.3 Conclusion and further research	205
8.4 Avalanche into a Reservoir	205
8.4.1 Investigation area	206
8.4.2 Modelling concept	207
8.4.3 Conclusion and further research	209
8.5 Log Jam Processes	209
8.5.1 Modelling concept	210
8.5.2 Results	212
8.5.3 Conclusion and further research	214

8.6	Sedimentation and Flushing of Alpine Water Intake Reservoirs . . .	214
8.6.1	Investigation area and data base	215
8.6.2	Modelling concept	216
8.6.3	Results and further research	218
