## **Total Synthesis of Hyperforin**

Ting, C. P.; Maimone, T. J. Am. Chem. Soc. 2015, 137, 10516

- 1) 1, CuBr•DMS, LiCl, TMSCl
- 2) MeLi•Lil then 2, HMPA then TsOH, Δ
- 3) LDA, prenyl bromide
- 4) LTMP, **3**
- 5) TMSCH<sub>2</sub>N<sub>2</sub>

- 6) PhI(OAc)<sub>2</sub>, KOH, MeOH 7) LTMP, TsCl
- 8) LTMP, i-PrCOCN,
- 9) i-PrMgBr•LiCl, LDA, Li(2-Th)CuCN, then prenyl bromide
- 10) LiCl, DMSO, Δ

What are the two major types of cuprates?

Hint: in step 2 there is also an isomerization

Propose a mechanism for step 4

What is the  $pK_a$  of LTMP?

Only A is taken forward. B can be recycled, how could this be done (2 steps)

Propose a mechanism for step 6

Suggest a reason that LDA was added in step 9.
