

Airborn Hydro Mapping @Uppenborn

13.02.2016, Christoph Rapp & Frank Steinbacher

Öffentlich

Stadtwerke München

- ▶ 100% municipality-owned
- ▶ turnover approx. 6 bn €/a
 - ▶ public transport
 - ▶ water supply
 - ▶ swimming pools & Olympic Park
 - ▶ oil & gas
 - ▶ power generation
 - ▶ 100% of Munich's private consumption + public transport renewable by 2015 (3.5 TWh/a)
 - ▶ 100% renewable including Munich's industry by 2025 (7.5 TWh/a)
 - ▶ 13 hydro power plants
 - ▶ annual production approx. 350 Mio. kWh/a (140.000 Munich households)
 - ▶ installed power approx. 160 MW

Content

- ▶ Introduction
- ▶ Motivation
- ▶ Airborne Laser Scanning
- ▶ Application
- ▶ Conclusion and Outlook

Uppenbornwerke

- ▶ Friedrich von Uppenborn (1859-1907)
 - ▶ Foundation of „Elektrizitätswerke München“
 - ▶ Electrification of Munich
 - ▶ 1907 „Altes Uppenbornwerk“, Isar-loop Moosburg (4.4 MW)
- ▶ Erection of Amper-Überleitungskanal 1922
- ▶ Erection of Mittlere Isar Kanal (1919-1925)
 - ▶ Extension of MIK to feed UP1 1926-1929
 - ▶ UP1, 24 MW, 1930 → closure
 - ▶ UP2, 18 MW, 1951

AHert Lizenziert unter CC BY-SA 3.0, Wikimedia Commons

Setting

81 Bridges
17 km Canals
16 Weirs
240 ha reservoirs (2.8 mio. m³ + 2.2 mio. m³)

60 km to Munich

Rehabilitation

- ▶ facilities erected more than 80 years ago
- ▶ execution planning available
- ▶ dataset analog ... and meanwhile biased?
- ▶ condition corresponds to the age of the plants
- ▶ secure operation aimed for
- ▶ concession ends by 2030 – good condition required for the so called „Heimfall“
- ▶ conformity of DIN 19700 → **actual dam layout required**

Energy Economics Optimization

1. management of the reservoirs („Schwellbetrieb“ in UP1) → **capacity curves required**
 - ▶ storage and canal desedimentation measures → **capacity curves required**
2. controlling power range (premier, secondary and tertiary)
3. maximization of the diversion discharge and operating water level → **detailed bathymetry required for hydraulic simulation**
4. maximization of the gross head → **downstream outflow condition needed at UP2 for hydraulic simulation**

Challenges

- ▶ water depth ≤ 9 m
- ▶ suspended load
- ▶ vegetation on land shadowing screening area
- ▶ aquatic plants

- ▶ however, terrestrial surveying hardly possible, time consuming and expensive

Results

- ▶ outliers had to be filtered
- ▶ holes were filled with terrestrial survey data (sonar)

DIN 19700 conformity

- ▶ Determination of
 - ▶ the slopes
 - ▶ the crown width of the dams
 - ▶ the accessibility
 - ▶ etc.

(De-)Sedimentation

- ▶ Determination of the impact on the gross head
 - ▶ sedimentation area downstream of UP2 at confluence of MIK and Isar
 - ▶ impact on the downstream flow-depth of UP2
 - ▶ gross head gain if removed
 - ▶ probability of re-sedimentation evaluated
 - ▶ decision not yet taken

(De-)Sedimentation

- ▶ determination of the lost volume capacity of the two reservoirs
 - ▶ upstream basin within respective water levels minor
 - ▶ downstream basin not negligible, however, removal with respect to environmental specifications hardly realizable

Impact of the sedimentation on the hydraulic head losses

- ▶ 1D hydraulic simulation (own development) at Amper-Überleitungskanal
 - ▶ sedimentation area detected
 - ▶ $\approx 5000 \text{ m}^3$ removed, capacity increased by approx. $4 \text{ m}^3/\text{s}$ allowing to increase production by $\approx 5 \text{ MWh/a}$

- ▶ 1D hydraulic simulation @Alter-Werkkanal

- ▶ sedimentation area detected
- ▶ additional gross head loss determined to be 5 cm @ $70 \text{ m}^3/\text{s}$
- ▶ removal would yield additional 300.000 kWh/a
- ▶ not yet decided

Optimization of operating water level at UP1

- ▶ water level at Isar weir max.: 412.47 mNN
- ▶ max. water level at UP1: 412.47 mNN
- ▶ optimization of gross head at UP1 depending on
 - ▶ $Q_{\text{Alter Werkanal}}$
 - ▶ $Q_{\text{MIK after confluence}}$

Conclusion

- ▶ setup very challenging for laser scanning
- ▶ appropriate replacement of outliers through sonar measurements mandatory
- ▶ data acquisition at hardly accessible places possible (e.g. protected areas)
- ▶ handed-over dataset met requirements
- ▶ application of the data yielded valuable results

... makes the customer happy.

Outlook

- ▶ data processing could be improved and accelerated
- ▶ improvement of data acquisition at challenging conditions desired

... will make the customer even more happy.

Thank you for your attention
